Why Is Water Blue

As light penetrates water the water absorbs light rays. Your water is probably crystal clear already. The bluish tint is something that cannot be taken away. It is the laws of physics at work.

As light penetrates water the water absorbs light rays. Blue light has the ability to travel the furthest in water. So as your pool gets deeper there is only going to be more blue light reflecting off the bottom.

This is the reason it looks more blue as the pool gets deeper.
